. A system for providing multiple time-division multiplexed (TDM) channels over a shared X-DSL communication medium, and the system comprising: a subscriber line;

a first modem with an input and an output and the first and a second modem communicating with one another across the shared communication medium with at least the first modem accepting a plurality of TDM channels at an input thereof;

a payload framer coupled with the first modem for accepting the plurality of TDM channels as an input and for placing data associated with each of the channels in a payload portion of the X-DSL frame; and

a payload deframer coupled with the second modem to demultiplex the payload data.
